

WORKBOOK — SECTION FIVE

PEEK, SPLIT-ATTENTION, AND ENTRY DESIGN

OPENING ENTRY

22. What PEEK type will you use first: curiosity, challenge, connection, humor, visual shock, or something else?

Answer: I will use curiosity and humor. I will invite the visitor to investigate why the archive scanner approved hundreds of duplicate entries.

23. Describe the specific opening. What does the learner see, feel, hear, or do in the first 5 minutes?

Answer: The visitor first sees a bold headline about the duplicate-record crisis, a clear archive visual, and one invitation to explore. The visitor can read the short company story or open the 3D prototype.

24. What emotional or cognitive state are you trying to create?

Answer: I want the visitor to feel curious, alert, and confident enough to investigate the problem without feeling overwhelmed.

SPLIT-ATTENTION AUDIT

25. List the biggest split-attention risks in your environment: screens, tabs, clutter, stress, tone, unclear directions, hunger, embarrassment, or something else.

Answer: The biggest risks are too many tabs, long paragraphs, competing images, unclear directions, notifications, and several buttons asking for attention at the same time.

26. What can you remove, soften, simplify, or sequence differently to reduce those leaks?

Answer: I will shorten the text, group related links, highlight one main action, reduce extra motion, and sequence the experience as Home, Company Blog, 3D View, and then Back to Home.

SCREENS AND RE-ENTRY

27. Where is screen use truly useful here, and where might low-tech or no-tech create better presence?

Answer: Screens are useful for reading the blog, navigating pages, and interacting with the 3D scene. A whiteboard and face-to-face peer discussion are better for planning and testing because they reduce tab switching.

28. How will you re-open attention at the midpoint when energy naturally drops?

Answer: At the midpoint, I will reveal the interactive 3D archive core and ask the visitor to rotate it, zoom in, and notice one change. This short hands-on task reopens attention.

29. How will you open the final, hardest section so the learner leans in instead of bracing away?

Answer: I will begin the hardest section with a simple prediction: What will happen if the sphere's diameter or color changes? The visitor can test one value and immediately compare the result.
